DATA

The information is about the tomography taken at essalud of the Ica region, of the specimen called "mummy maria".

Photographs of the specimen sent by the applicant

FROM THE REFERRED TOMOGRAPHIC EVALUATION

1. The hands only have 3 fingers and the carpo metacarpal joints are intact, no mutilation is evident. Each finger has more than 3 articulated phalanges. Humans have 5 fingers and 3 phalanges in each finger.
2. The feet only have 3 fingers and the tarso metatarsal joints are intact and articulated, no mutilation is evident. Each finger has more than 3 phalanges.
3. The elongated head without signs of compression by external agents with a cranial vault volume close to 30% greater than human.
4. The transverse diameter of the eye orbits are greater than the vertical diameters, in humans it is the reverse.
5. It has 4 lumbar vertebrae, humans have 5.
6. Inside the sacral bone there is a metallic-looking element, without any sign of scarring (bone intact throughout the periphery) due to surgical placement. Humans do not have metallic-looking artifacts inside any bone, and if they do, it is traumatic and with signs of scarring.

ANALYSIS

The failure to detect the intraosseous artifact in the sacrum is evidence of the absence of diligence in the observation of the studied specimen.

The failure to detect the multiple anomalies outside the human even as "multiple congenital anomalies" of unknown origin confirms the absence of diligence in the observation of the studied specimen.

CONCLUSIONS

1. The studied specimen called mummy Maria IS NOT HUMAN.
2. The studied specimen called mummy Maria HAS NO EVIDENCE OF MUTILATIONS to make it look like 3 fingers.
3. There is evidence of absence of diligence in the observation of the tomography taken by essalud Ica region of the specimen called mummy Maria.
